                                                                                                                                                 were amplified by primers T65798-T66047. Those clones where the repeat sequence has been determined are shown in T65704-797. This repeat sequence is from the marker clone Mdf69 which contains the repeat sequence having the formula: (AC)18.5A(AC)3.

pr d(G-dA)n(dG-dT)n - using novel nucleic acid mols. as primers

ps Claim 1; Column 13-14; 186pp; English.

Ps Claim 1; Column 13-14; 186pp; English.

CC having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic

CC markers. Primers based on these sequences can be used to detect these

CC repeats, especially for use in e.g paternity or maternity testing,

CC human genetic analysis such as linkage analysis of genetic disease,

CC commercial animal or plant breeding or pedigree analysis. Clones

CC containing the repeat sequences were isolated by hybridisation of

CC chromosome-specific phage libraries with a synthetic poly(GC-dA).(dG-dT)

CC probe. Over 100 repeat blocks were isolated. The inserts from the clones

CC were amplified by primers T65798-T6607. Those clones where the repeat

CC sequence has been determined are shown in T65704-797. This repeat

CC sequence has been determined are shown in T65704-797. This repeat

CC sequence having the formula: (AC)19AA(AC)5A.

SO Sequence 51 BP; 27 A; 24 C; 0 G; 0 U;
gene mapping, and selective breeding
Table 7: Page 301: 517pp; English.
The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between
screening a library of bovine MboI DNA fragments of between
conclut of 50 clones cross-hybridised. Assuming independent
distribution of microsatellites and MboI sites, the frequency of
(76)n >9 microsatellites in the bovine genome is estimated at >100,
conclut of 50 clones cross-hybridised. Assuming independent
conclut of 50 clones cross-hybridised. Assuming independent
conclude the frequency of
the sequence information for ca. 230 such bovine microsatellites
is summarised in the specification and indexed herein (see below).
The sequences upstream and downstream of the microsatellite sequence
were used to generate the required PCR primers for in vitro
amplification of the corresp microsatellite (using the program
optification of the corresp microsatellite mapping of economic trait
coloci, or genes involved the determinism of economically important
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

PT Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding STAble 7; Page 269; 51/pp; English.

CC The sequence is that of a bovine microsatellite sequence obtd. by cc screening a library of bovine mbor DNA fragments of between CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. CC one out of 50 clones cross-hybridised. Assuming independent CC (300 clones cross-hybridised. Assuming independent CC (301 clones cross-hybridised. Assuming independent CC (301 clones cross-hybridised. Assuming independent content of microsatellites and MboI sites, the frequency of (301 closs) partners in the bovine genome is estimated at >100, CC (301 closs) partners for ca. 230 such bovine microsatellites compared in the specification and indexed herein (see below).

CC The sequences upstream and downstream of the microsatellite sequence complification of the corresp. microsatellite (using the program complification and in the general complification trait complication and in the general complification and interest complification and indexed herein (see below).

CC The sequence used to generate the required PC (using the program complification of the corresp. microsatellite (using the program complification of the corresp. microsatellite (using the program complification and indexed herein (see below).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PT Polymorphic bowine DNA markers - used in genetic identification, PT gene mapping, and selective breeding
PS Table 7; Page 261; 517pp; English.

CC The sequence is that of a bowine microsatellite sequence obtd. by
CC screening a library of bowine MboI DNA fragments of between
CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucjectide probe.
CC one out of 50 clones cross-hybridised. Assuming independent
CC distribution of microsatellites and MboI sites, the frequency of
CC (T6)n >9 microsatellites in the bowine genome is estimated at >100,
CC (T6)n >9 microsatellites in the bowine genome is estimated at >100,
CC occ summarised in the specification and indexed herein (see below).
CC The sequences upstream and downstream of the microsatellite sequence
CC were used to generate the required PCR primers for in vitro
CC amplification of the corresp. microsatellite (using the program
CC OPTIPRIM). The microsatellites may be used to identify individuals,
CC for parentage testing, and in the genetic mapping of economic trait
CC traits esp. in cattle, to allow selective breeding.
CC see also Q33501-34437.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Prolymorphic bovine DNA markers - used in genetic identification, properly gene mapping, and selective breeding rable 7; Page 311; 517pp; English.

Compared to the sequence is that of a bovine microsatellite sequence obtd. by the sequence is that of a bovine microsatellite sequence obtd. by the sequence is that of a bovine microsatellite sequence between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent of distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, occurred to the sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence upstream and downstream of the microsatellite sequence complification of the corresp. microsatellite (using the program of the total and the sequence of the microsatellite (using the program of the corresp. Prable 7: Page 347: 517pp; English.
CC The sequence is that of a bowine microsatellite sequence obtd. by
CC screening a library of bowine MboI DNA fragments of between
CC 50 and 500 bp with an (AC)15 and a (CC)15 oligonucleotide probe.
CC distribution of microsatellites and MboI sites, the frequency of
CC (T6)n > microsatellites in the bowine genome is estimated at >100,
CC 000. The sequence information for ca. 230 such bowine microsatellites
CC is summarised in the specification and indexed herein (see below).
CC the sequences upstream and downstream of the microsatellite sequence
CC amplification of the corresp. microsatellite (using the program
CC opTIPRIM). The microsatellites microsatellite (using the program
CC opTIPRIM). The microsatellites and be used to identify individuals,
CC of arentage testing, and in the genetic mapping of economic trait
CC loci, or genes involved the determinism of economically important
CC traits esp. in cattle, to allow selective breeding.

rable 7: Page 402; 517pp; English.

CC The sequence is a boyine microsatellite sequence obtd. by
cs screening a library of boyine Morrosatellite sequence so to be tween
cc 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.

CC One out of 50 clones cross-hybridised. Assuming independent
distribution of microsatellites and Mbol Sites, the frequency of
cc (T6)n >9 microsatellites in the boyine genome is estimated at >100,
cc (00). The sequence information for ca. 230 such boyine microsatellites
cc is summarised in the specification and indexed herein (see below).

CC The sequences upstream and downstream of the microsatellite sequence
cc amplification of the corresp. microsatellite (using the program
cc opTIPRIM). The microsatellites may be used to identify individuals,
cc for parentage testing, and in the genetic mapping of economic trait
cc loci, or genes involved the determinism of economically important
cc traits esp. in cattle, to allow selective breeding.

PT Polymorphic bovine DNA markers - used in genetic identification, properly gene mapping, and selective breeding properly gene mapping, and selective broine microsatellite sequence obtd. by General State of Solones (AC)15 and a (TC)15 oligonucleotide probe. CC one out of 50 clones cross-hybridised. Assuming independent cdistribution of microsatellites and MboI sites, the frequency of (CC one out of 50 clones cross-hybridised. Assuming independent cdistribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below).

CC The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program CC oppipriny). The microsatellites may be used to identify individuals, cf or parentage testing, and in the generatic mapping of economic trait crait craits esp. in cattle, to allow selective breeding.

Detection of polymorphic genetic markers of the form
pr (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers
pr (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers
pr (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers
pr (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers
pr (dC-dA)n(dG-dT)n which can be used as genetic
proved the invention relates to the isolation of polymorphic repeat sequences
proved the invention relates to the isolation of polymorphic repeat of detect these
proved the invention of the sequence analysis of genetic disease,
proved the repeats which as linkage analysis of genetic disease,
proved the repeats which are alternating the termity of the repeats with no
proved interruptions and without adjacent repeats of another sequence;
proved the repeats which are defined as 2 or more runs of uninterrupted
proved the repeats which are uninterrupted runs of CA separated
proved the repeats which are uninterrupted runs of CA separated
proved the repeats which are uninterrupted mononucleotides; and
proved the repeats which are defined as for the perfect
compound repeats which are defined as for the perfect
compound repeats which are defined as for the perfect
compound repeats which are defined as for the perfect
compound repeats which are defined as for the perfect
compound repeats which are defined as for the perfect

compound repeats which are defined as for the perfect
compound repeats which are defined as for the perfect
compound repeats which are defined as for the perfect
compound repeats which are defined as for the perfect
compound repeats which are runs of CA are not the runs of CA are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   x_{0}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PS Disclosure; Column 9-10; 186pp; English.

CC The invention relates to the isolation of polymorphic repeat sequences

CC having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic

CC markers. Primers based on these sequences can be used to detect these

CC commercial for use in e.g paternity or maternity testing,

CC human genetic analysis such as linkage analysis of genetic disease,

CC commercial animal or plant breeding or pedigree analysis. Clones

CC containing the repeat sequences were isolated by hybridisation of

CC chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT)

CC probe. Over 100 repeat blooks were isolated. The inserts from the clones

CC were amplified by primers 765798-766047. Those clones where the repeat

CC sequence has been determined are shown in 765704-797. This repeat

CC sequence is from the marker clone Mdf30 which contains the repeat

CC sequence aving the formula (AC)185.

PT Detection of polymorphic genetic markers of the form

PT Detection of polymorphic genetic markers of the form

PT (dc-dA)n(dG-dT)n - using novel nucleic acid mols as primers

PS Disclosure; Column 11-12; 186pp; English.

CC The invention relates to the isolation of polymorphic repeat sequences

CC thaving the sequence (dC-dA)n.(dG-dT)n which can be used as genetic

CC markers. Primers based on these sequences can be used to detect these

CC containing the sepecially for use in e.g paternity or maternity testing;

CC human genetic analysis such as linkage analysis of genetic disease,

CC containing the repeat sequences were isolated by hybridisation of

CC chromosome-specific phage libraries with a synthetic poly(dC-dA) (dG-dT)

CC probe. Over 100 repeat blocks were isolated. The inserts from the clones

CC were amplified by primers 765798-766047. Those clones where the repeat

CC sequence has been determined are shown in 765704-797. This repeat

CC sequence has been formula: (CA)19.

CS sequence avaing the formula: (CA)19.

CC sequence avaing the formula: (CA)19.

CC sequence avaing the formula: (CA)19.

Table 7; Page 189; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by creening a library of bovine mboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.

Cone out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, clones from the sequence information for ca. 230 such bovine microsatellites on the specification and indexed herein (see below).

The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program of Themicrosatellites amplification of the corresp. microsatellite (using the program of corporately testing, and in the genetic mapping of economic trait traits esp. in cattle, to allow selective breeding.

Individual FH 295 carries two mutant LDL receptor alleles. The allele below was inherited from the father and includes a duplication of exons 2 through 8 that was presumably created by unequal chromosomal crossover involving Alu repeats in introns 1 and 8. The exact site of recombination cannot be determined because the sequences of the Alu repeats in introns 1 and 8 of normal alleles are identical over a span of 26 nucleotides at the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Homo sapiens

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
